2023

What is needed  
from EU Earth Observation data  
to support climate services

#EUSpace 

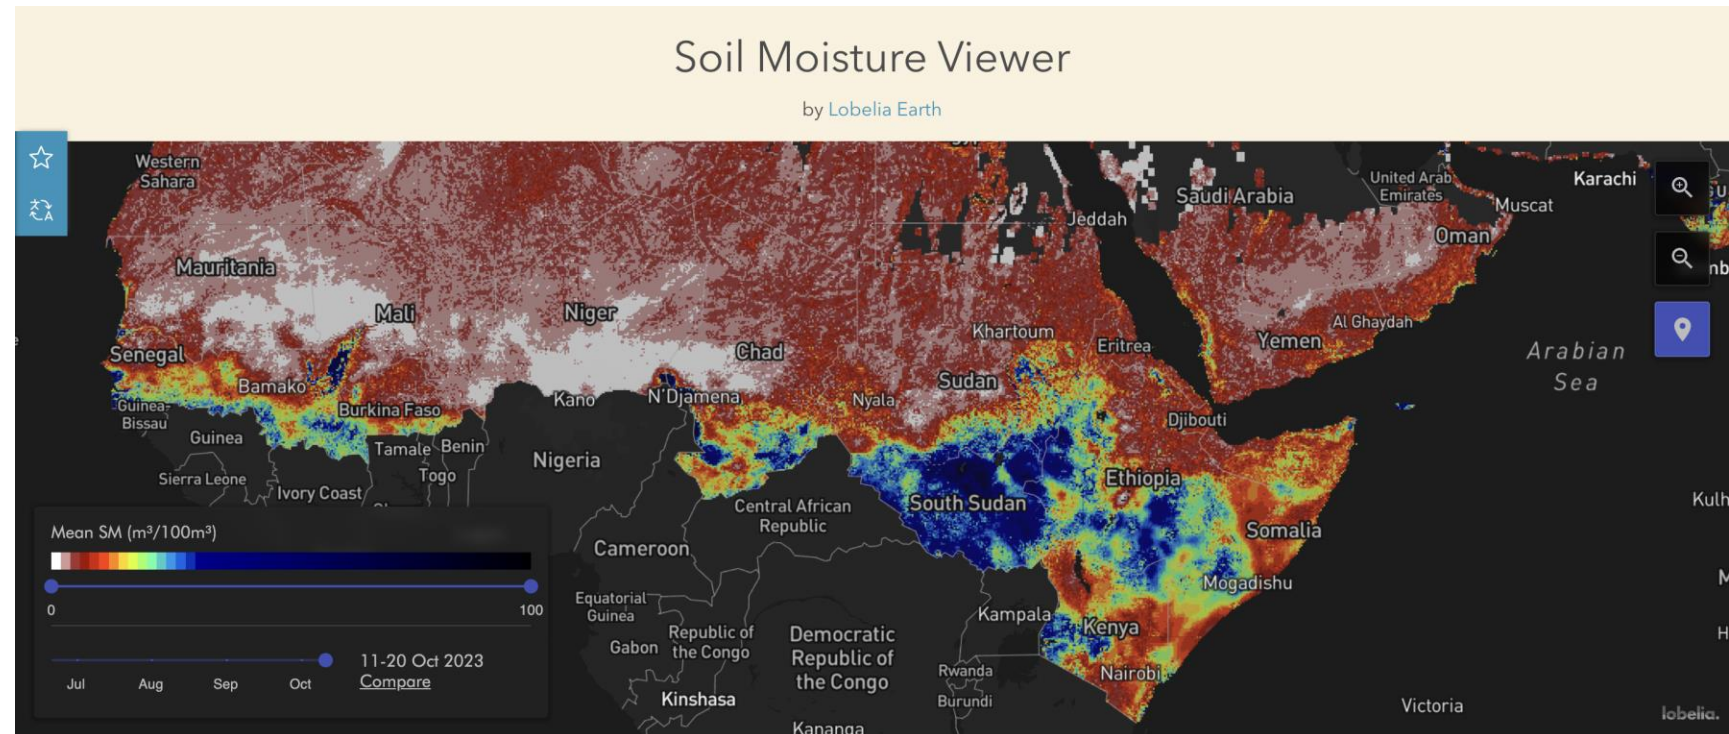

# Soil moisture with L-band radiometer

SMOS sensitivity helps us monitor soil moisture and inform droughts, floods and heatwaves.

SMOS is beyond its life cycle and Sentinel 1 does not provide the same quality in semi-arid areas.

Need for L-band radiometers

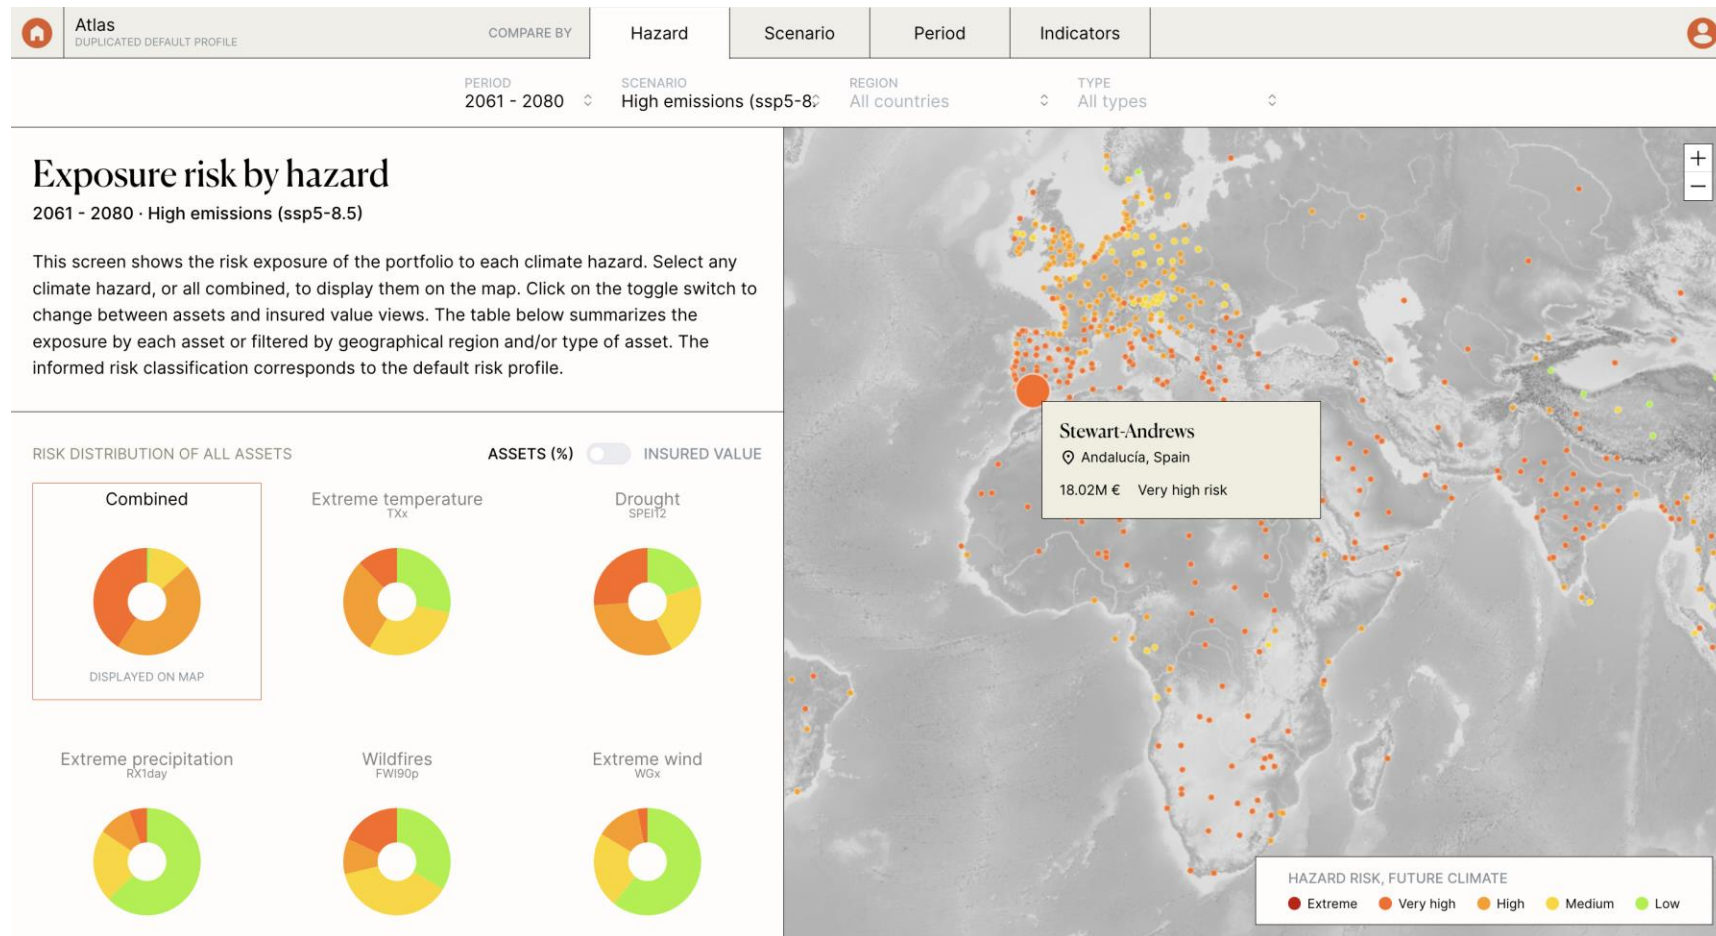

Food and Agriculture  
Organization of the  
United Nations

Locust Hub

# High resolution surface Temperature

High temporal and spatial resolution is key for:

- Drought monitoring
- Process SMOS data
- Bias adjust climate data

# 3

## A Service Level Agreement (SLA)

Land, ocean and climate data have SLAs.

Space data need similar SLAs

Operational services for clients can't fail. We need reliability in the delivery of images and the expected release dates.

## 4

# Data access without quotas

Data quotas can kill some commercial opportunities.

The download of large volumes of data without quotas should be possible.

Serving geospatial big data is not easy and requires work on the alignment of data access technology.

## 5

# Transparency on delivery

If there is an error, all users need to know it as soon as possible.

Operational services require all related information, including possible errors.

This is key to avoid penalties for breaching our SLAs with final clients.
